Dear Hiring Manager,

I'm excited to apply for the Manager, Platforms & Automation role, as my current work already aligns closely with the platform ownership, workflow configuration, and automation responsibilities this role requires. Over the past six months, my role has evolved into platform and workflow operations, including agent-guided workflow administration, platform configuration, lifecycle governance, and automation design. This shift has given me a clear view of the systems that support Spark Driver and the opportunities to strengthen them at scale.

In my current role, I manage complex workflows in CCA2, auditing content for accuracy and consistency while translating system behavior into clear guidance for non-technical partners. I designed an AI-driven workflow export system that converts JSON workflows into structured documentation, cutting hours of manual effort down to minutes and improving cross-team visibility. I have also built structured process improvement trackers, consolidated support entry points into UX-aligned decks, and identified platform inconsistencies to drive operational alignment. This work has reinforced how much I enjoy improving platform clarity, reducing manual effort, and building durable systems that scale across teams.

My background prior to Walmart further supports this role. At Medtronic, I developed PowerShell automation to streamline deployments and authored technical documentation that improved first-pass resolution. At the City of Fort Smith, I managed large-scale device deployments and standardized IT workflows across departments. In parallel, my freelance work strengthened my platform administration skills across Klaviyo, Mailchimp, ActiveCampaign, GoHighLevel, and WordPress - designing automated email flows, maintaining list health, and building dashboards and CMS-driven sites for clients.

What excites me most about this opportunity is the chance to formalize the platform stewardship and automation work I'm already contributing, and to support the systems that directly shape the Spark Driver experience. I'm confident in my ability to optimize core communications and content platforms, drive adoption of scalable workflows, and translate technical systems into clear, actionable guidance for internal teams and gig drivers.

Thank you for considering my application. I look forward to discussing how my platform experience, systems thinking, and automation-first approach can support platform excellence and long-term operational impact for Last Mile Delivery.

Sincerely,

Austin Lee Kelly
